

HOW FIT IS YOUR PROPERTY?

INTRODUCING PROPFIT

Environmental concerns are paramount to many vertical industries. Hospitality, workplace, and residential market segments all have a growing interest in knowing their environmental conditions. This is particularly true when a dwelling is not regularly occupied, resides near an agricultural or industrial setting prone to potential pollutants, or in densely populated areas such as cities.

Lifescale Analytics **PropFIT** monitoring system oversees the fitness of residential or commercial buildings by providing continuous coverage and notifications if a property is affected by pollutants or environmental concerns. **PropFIT** monitors for activity in a location through a sensor device. If there is a fluctuation, the device reports that change to an easily accessible dashboard which provides a drill-down capability to see exactly what is impacted.

PropFIT dashboards provide drill-down capabilities, so you can not only see what is going on at a specific location but where exactly the issue is located. This allows enhanced visibility to assist with:

 Enabling homeowners to monitor basements and crawlspaces for unwanted pests and environmental conditions that could result in mold growth.

 Overnight rental property managers who manage multiple rental property locations can improve guest satisfaction and cost margins with energy monitoring and notifications when the property is occupied.

 Monitoring occupancy and traffic patterns in a building to determine back to work strategies.

Contact Lifescale Analytics so you can see if it is a good *Fit* for you!
